## **BrainInfo: A Portal to Neuroanatomy on the Web**

**Douglas M. Bowden, MD, Mark Dubach, PhD**

Dept. of Psychiatry and Behavioral Sciences, School of Medicine, and Neuroscience Division,  
National Primate Research Center, University of Washington, Box 357330, 1705 NE Pacific St.,  
Seattle, WA 98195-7330

Posted 11 January, 2005.

### **Abstract**

The BrainInfo website is a portal to neuroanatomical information on the Web (BrainInfo 2005). It is designed particularly for neuroscientists who feel limited in their knowledge of brain anatomy and who wish to obtain a broad, rapid and accurate orientation to neuroanatomical concepts.

An unusual feature of BrainInfo is that it allows visitors to locate information by navigating intuitively according to the logic of neuroscientific inquiry rather than by navigating websites organized to simulate libraries. Users go directly from the home page to the information they seek without having to navigate a series of menus and site maps wondering whether the information is there and, if so, where. They need not learn how the website is organized, because a concept-based ontology allows the indexation and retrieval of text and image information at a high level of detail.

Once a user has found the specific information he or she seeks, the system assists in proceeding directly to the next information of interest without needing to return to a home page and regardless of whether that information is on the same server or on a server thousands of miles away.

Besides offering access to information recorded in words and numbers BrainInfo provides access to an unusually large number of illustrations, including anatomic diagrams, movies, original photomicrographs and data mapped to a standard brain atlas. Visitors to BrainInfo can display, on a single screen photos of the architectonic structure of cortical areas published by numerous neuroanatomists during a century of research, click and drag them to optimal positions for visual comparison and, if they are named differently, determine the original authors' reasons for regarding them as equivalent.

A public scientific resource BrainInfo offers rapid access to the large and growing body of neuroscientific knowledge available on the Web.

## Introduction

The advent of whole brain surveys for gene expression has exposed a problem with neuroanatomical nomenclature that went largely unrecognized before scientists were able to collect extensive, detailed data on brain systems unfamiliar to them. Powerful new genomic and imaging techniques have brought to neuroscience many investigators whose knowledge of neuroanatomy is minimal but who, nevertheless, have a keen interest in learning about brain structures that exhibit the phenomena they study. With estimates of the number of functionally unique cell groups in the brain ranging between 500 and 1000 and with an average of six legitimate English and Latin names for each structure (Bowden and Martin 1995; Bota, Dong et al. 2003), scientists from disciplines as diverse as molecular biology and psychiatry have every reason to be confused as they read the literature on brain areas newly of interest to them.

Fortunately the same computer and information technologies that enable scientists to acquire massive amounts of high-resolution data about the whole brain also make it possible to speed access to information about individual brain structures. The rapid adoption of the World Wide Web as a medium for sharing information about the brain, and the development of BrainInfo (BrainInfo 2005) as a portal to relevant websites, are enabling scientists to obtain in a few minutes an orientation to knowledge about specific areas that would otherwise require hours or days of poring over textbooks, atlases and review articles.

## Website Description and *Modus Operandi*

Suppose a neurochemist reads a report that expression of a particular gene has been demonstrated in ‘area tegmentalis’ and wonders whether area tegmentalis is related to the ‘prerubral area’ where he himself has reported concentrations of a particular neuropeptide. If he goes to Google (Google 2005) and enters ‘area tegmentalis’ (Fig. 1) he obtains a long list of web addresses that may or may not contain the information he seeks (Fig. 2). Because Google knows that BrainInfo contains information about all names of brain structures that have appeared in PubMed abstracts in the past 25 years, including ‘area tegmentalis’, a button link to BrainInfo appears in the upper right corner of the listing. A click on ‘BrainInfo Knowledge Base’ takes him to BrainInfo (Fig. 3).

**Figure 1: Google’s search box with the entry ‘area tegmentalis’.**

Search by Name of Brain Structure

Search by Browsing the Brain Atlas

BrainInfo is designed to help you identify structures in the brain. If you provide the name of a structure, BrainInfo will show it and tell you about it.

If you don't know the name but can locate the structure in the Template Atlas of the Primate Brain, BrainInfo will tell you its name and other facts about it.

**Figure 3: BrainInfo's home page.**

Clicking ‘Search by Name’ on the home page (Fig. 3) enables the visitor to obtain information using any of a number of neuroanatomical names and acronyms in several languages (Fig. 4). Submission of the term ‘area tegmentalis’ produces the list of terms in Figure 5.

**For what brain structure would you like to search?**

Enter its name into the box below:

area.tegmentalis

The first few letters of keywords in the name will suffice.  
(e.g. 'sup temp gyr' for superior temporal gyrus.)

**Search by Acronym**

Some terms in languages other than English and Latin can be found below:

**Figure 4: BrainInfo’s search page allows one to search for information using any of 15,000 neuroanatomical acronyms and terms in English, Latin and five other languages.**

**area tegmentalis appears in names of the following structures**

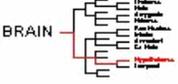

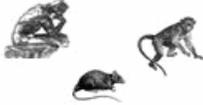

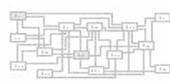

All Matches	Standard Names
Area tegmentalis H	<a href="#">field H</a>
Area tegmentalis	<a href="#">field H</a>
Area tegmentalis, pars dorsalis	<a href="#">field H1</a>
Area tegmentalis, pars dorsalis (Forel)	<a href="#">field H1</a>
Area subthalamica tegmentalis, pars dorsomedialis	<a href="#">field H1</a>
Area tegmentalis H1	<a href="#">field H1</a>
Area tegmentalis, pars ventralis (Forel)	<a href="#">field H2</a>
Area subthalamica tegmentalis, pars ventrolateralis	<a href="#">field H2</a>
Area tegmentalis ventralis	<a href="#">ventral tegmental area</a>

**Figure 5: The string of characters ‘area tegmentalis’ occurs in names of several structures.**

The string ‘area tegmentalis’ occurs in nine names for four different structures. For each name BrainInfo displays a standard name for the corresponding structure. For example, in Fig. 5 the first two terms refer to BrainInfo’s ‘field H’, the next four to BrainInfo’s ‘field H1’, and so forth. The exact match for ‘area tegmentalis’ is ‘field H’. Clicking there brings up the central directory to information about the structure (Fig. 6). To determine whether ‘field H’ is the same as the ‘prerubral area’ the visitor clicks ‘Other Names for It’.

## field H

Abbreviation: H

<p><b>Where is It in the Brain?</b></p> 	<p><b>What is Written about It?</b></p> 
<p><b>Show It!</b></p> 	<p><b>Other Names for It</b></p> <p>Encephalon 腦  MO3I <b>BRAIN</b> cerebro  cerveau <b>Gehirn</b></p>
<p><b>Internal Structure</b></p> 	<p><b>Which Species Have It?</b></p> 
<p><b>What Cells Does It Have?</b></p> 	<p><b>Connectivity</b></p> 
<p><b>Genes Expressed There</b></p> 	<p><b>Genes Expressed There</b></p>

**Figure 6: BrainInfo’s central directory to information about ‘field H’. Grayed cells refer to kinds of information that are not available for this particular structure.**

He finds that, indeed, ‘prerubral area’ and ‘prerubral field’ are synonyms of ‘field H’ (Fig.7). He also learns that ‘field H’ is by far the most commonly used name, having appeared in 218 PubMed citations in the past 25 years (Fig. 7, Col. 3). The second most common name,

‘Forel’s field’, appeared in only 20 publications, and ‘area tegmentalis’ in 10. Links in columns 4 and 5 lead to information about an atlas, textbook or article where the term in the first column is used and the species on which that source is based: human, macaque, rat or mouse.

## field H

Standard Acronym: **H**

Common English & Latin Names	Language	PubMed Citations	Source	Species
field H	English	218	Carpenter-83	human
field H	English	218	Martin-97	Macaca fascicularis
Forel's field H	English	20	Carpenter-83	human
H field of Forel	English	4	Roberts-70	human
prerubral area	English	6	Heimer-95	human
prerubral field	English	8	Carpenter-83	human
Area tegmentalis	Latin	10	Shantha-68	Macaca fascicularis

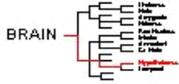

[Show All English & Latin](#)
[Show All Languages](#)
[Show Acronyms](#)

**Figure 7: BrainInfo lists all English and Latin synonyms for field H that have appeared in PubMed in the past 25 years. By clicking a button below the table one can view *all* English and Latin synonyms, equivalent terms in other languages and acronyms for the structure.**

The visitor may wish to ask, ‘Is field H located in the diencephalon or the midbrain?’ In this case he returns to the central directory for field H and clicks ‘Where is It in the Brain?’ (Fig. 8). Because field H is a structure in the classical neuroanatomical hierarchy (IANC 1983; Bowden and Martin 1995), clicking ‘Where is It?’ takes him to the part of the hierarchy that shows field H to be part of the subthalamus (Fig. 9); clicking the arrow in the upper left of the screen reveals that the subthalamus is part of the diencephalon (not shown).

# field H

Abbreviation: H

<p><b>Where is It in the Brain?</b></p> 	<p><b>What is Written about It?</b></p> 
<p><b>Show It!</b></p> 	<p><b>Other Names for It</b></p> <p>Encephalon         MO3Γ <b>BRAIN</b> cerebro        cerveau <b>Gehirn</b></p>

**Figure 8: To determine where in the classical hierarchy of brain structures field H is located one clicks ‘Where is It in the Brain’.**

## Location in English Hierarchy of Brain Structures

 to superstructures

SUBTHALAMUS

Volumetric Structures

Predominantly Gray

- [nucleus of ansa lenticularis](#)
- [nucleus of field H](#)
- [subthalamic nucleus](#)
- [zona incerta](#)

Predominantly White

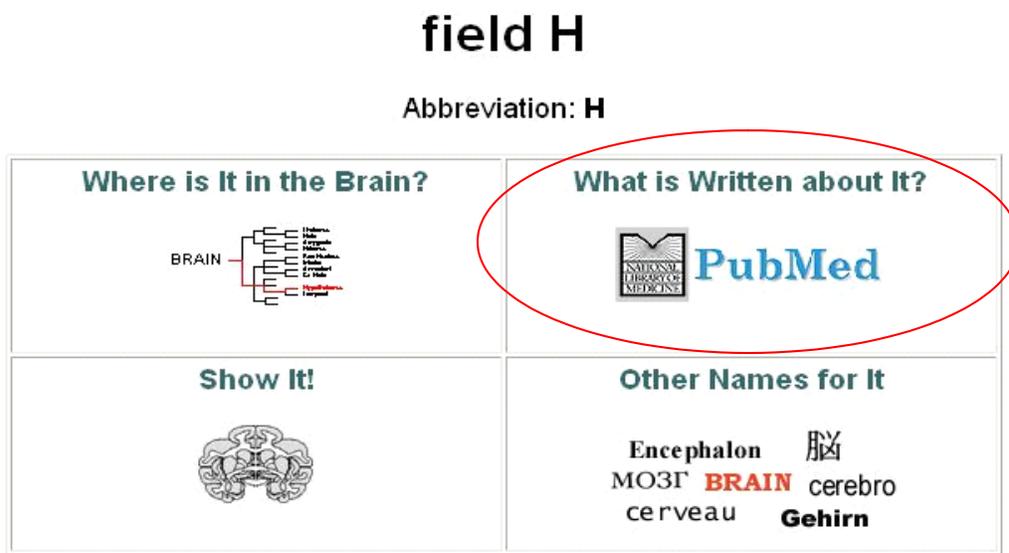

- [ansa lenticularis](#)
- [ansa peduncularis](#)
- [capsule of subthalamic nucleus](#)
- [field H](#)
- [field H1](#)
- [field H2](#)

Latin  

Click here to see the same part of the hierarchy in Latin

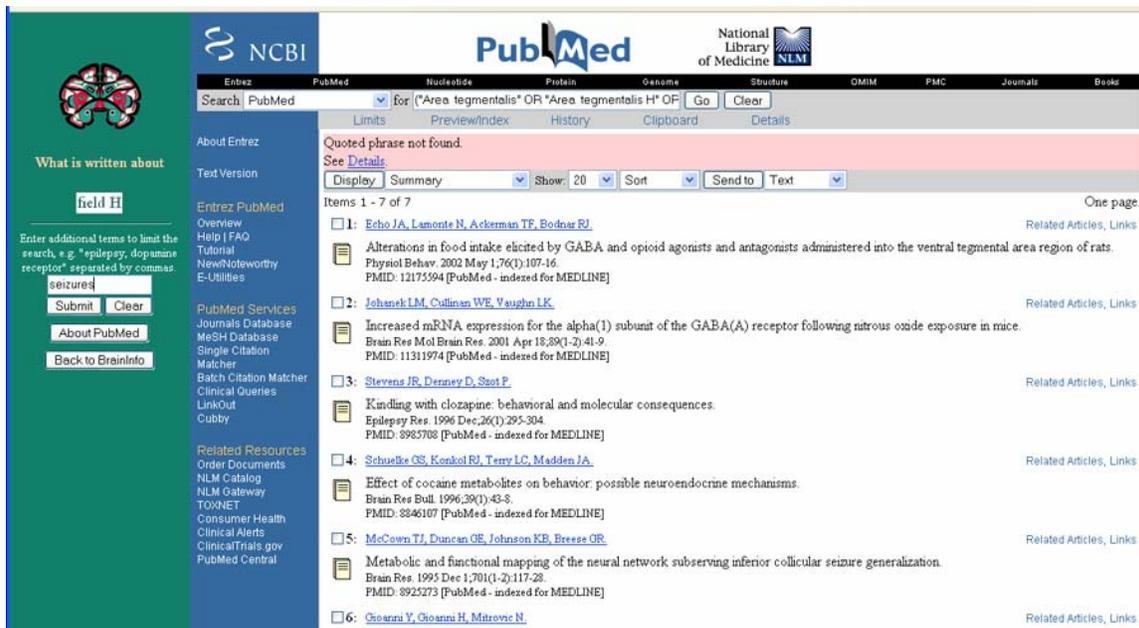

**Figure 9: Field H is in the subthalamus. A click on the arrow (upper left) will show the subthalamus to be part of the diencephalon.**

Perhaps the visitor has a clinical interest in whether field H (also known as area tegmentalis or the prerubral area) plays a role in brain seizures. If so, he can learn about it by returning to the central directory and clicking ‘What is Written about It?’ (Fig. 10).

**Figure 10: ‘What is Written about It?’ links the visitor to abstracts in PubMed that contain information about field H.**

BrainInfo composes a query to PubMed (PubMed 2005) that includes not only the terms ‘field H’ and ‘seizures’, but all of the synonyms of ‘field H’. Thus, the visitor does not need to run separate searches for ‘seizures AND area tegmentalis’, seizures AND prerubral area’, etc.

The screenshot shows the PubMed search results for the query "field H". The search bar contains the text "field H" and the search results are displayed as a list of seven citations. The citations are as follows:

- 1: [ECHO JA, LAMONTE N, ACKERMAN TP, BODNAR RJ.](#) Alterations in food intake elicited by GABA and opioid agonists and antagonists administered into the ventral tegmental area region of rats. *Physiol Behav.* 2002 May 1;76(1):107-16. PMID: 12175594 [PubMed - indexed for MEDLINE]
- 2: [JOHANEK LM, CULLINAN WE, VAUGHN LK.](#) Increased mRNA expression for the alpha(1) subunit of the GABA(A) receptor following nrotros oxide exposure in mice. *Brain Res Mol Brain Res.* 2001 Apr 18;89(1-2):41-9. PMID: 11311974 [PubMed - indexed for MEDLINE]
- 3: [STEVENS JR, DERNEY D, SPOT P.](#) Kindling with clozapine: behavioral and molecular consequences. *Epilepsy Res.* 1996 Dec;26(1):295-304. PMID: 8983708 [PubMed - indexed for MEDLINE]

- 6: [OSANNI Y, GIOANNI H, MITROVIC N.](#)

**Figure 11: PubMed displays seven citations about field H and seizures.**

The examples presented so far relate to situations in which the investigator seeks information about a structure whose name he knows. BrainInfo can also provide assistance to an investigator who finds gene expression in an unfamiliar area of the brain (Fig. 12)

**Figure 12: An investigator found the heaviest stain for type 1 adenylyl cyclase in the circled area of the macaque brain (Kumar, Baker et al. 2001). Is it in the dentate gyrus, the hippocampus, or some other part of the hippocampal formation?**

To identify such a structure she can go to BrainInfo, select 'Search Atlas' (Fig. 13) and select a view of the brain that corresponds to the image, in this case a coronal plane of section (Fig. 14).

# BrainInfo

Search by Name of  
Brain Structure

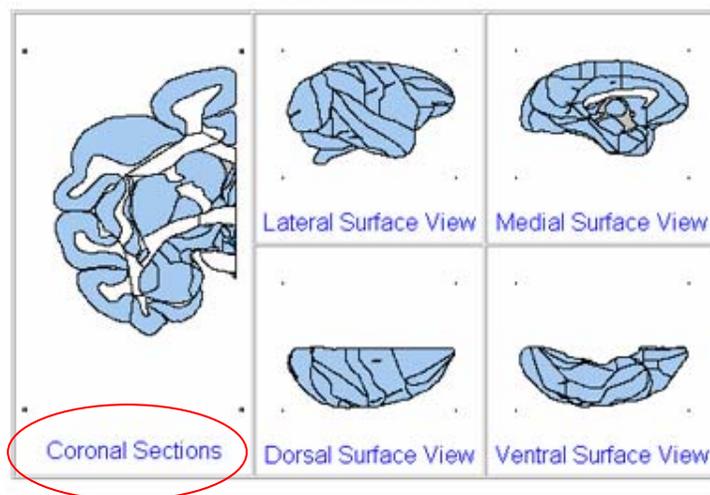

BrainInfo is designed to help you identify structures in the brain. If you provide the name of a structure, BrainInfo will show it and tell you about it.

Search by Browsing  
the Brain Atlas

If you don't know the name but can locate the structure in the Template Atlas of the Primate Brain, BrainInfo will tell you its name and other facts about it.

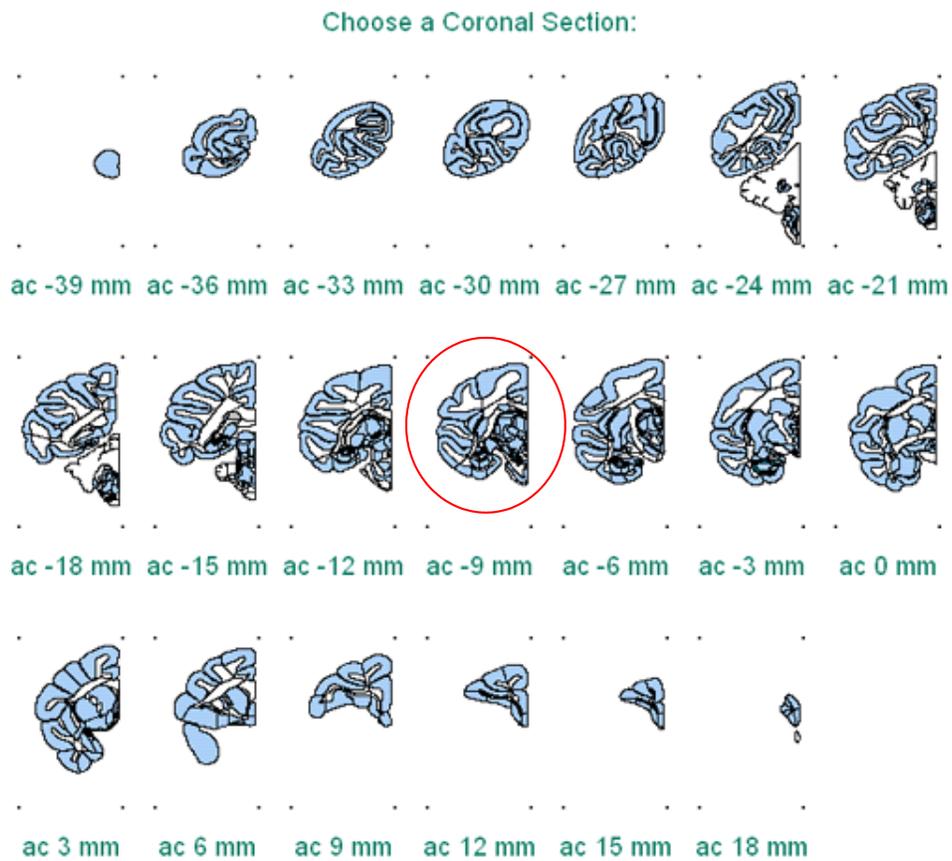

**Figure 13: To identify an unfamiliar structure click 'Search by Browsing the Brain Atlas'.**

Select a View:

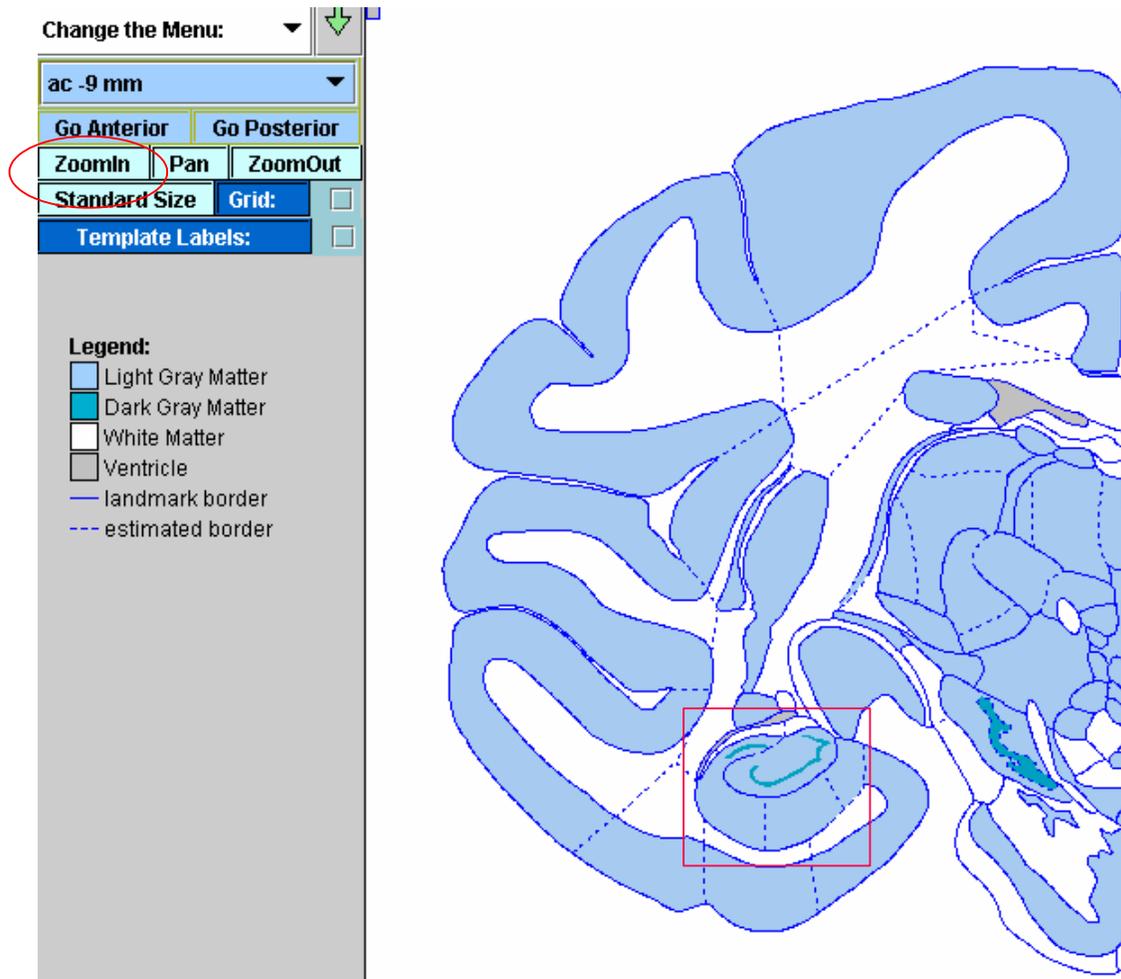

**Figure 14: To select from a set of cross-sections one clicks 'Coronal Sections'.**

BrainInfo displays thumbnails of cross-sections of a macaque brain from which the visitor selects a section most representative of the experimental section (Fig. 15).

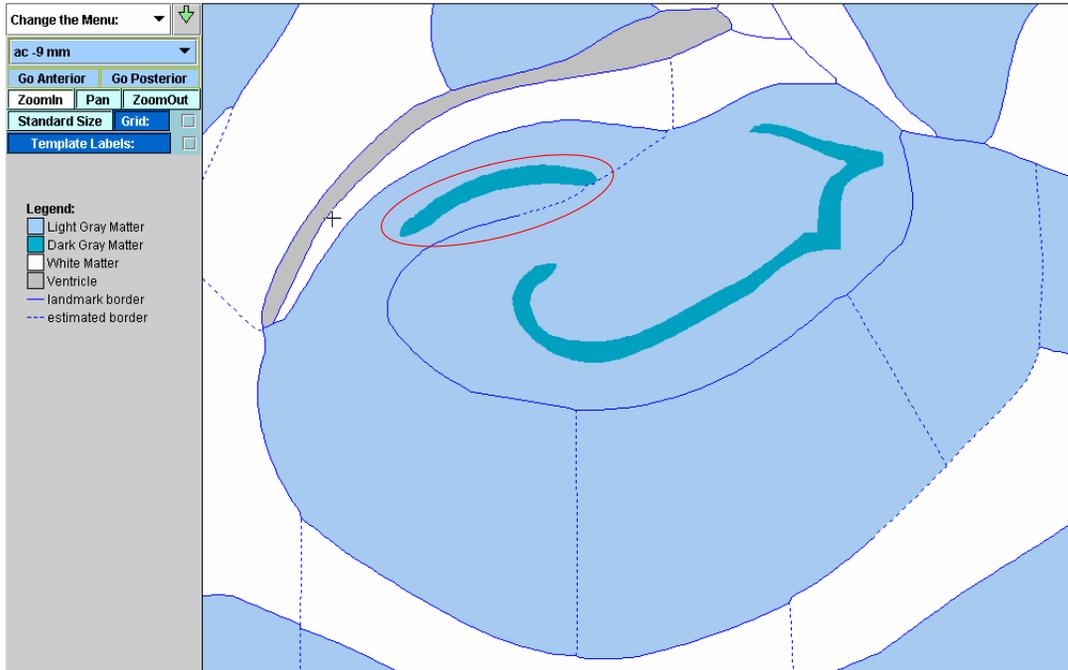

**Figure 15:** For the example in Figure 12, the experimental slide matches most closely section ac -9, the section 9 mm posterior to the anterior commissure.

The visitor clicks the thumbnail that most nearly matches the experimental section (Fig. 15) and BrainInfo displays an enlarged view (Fig. 16)

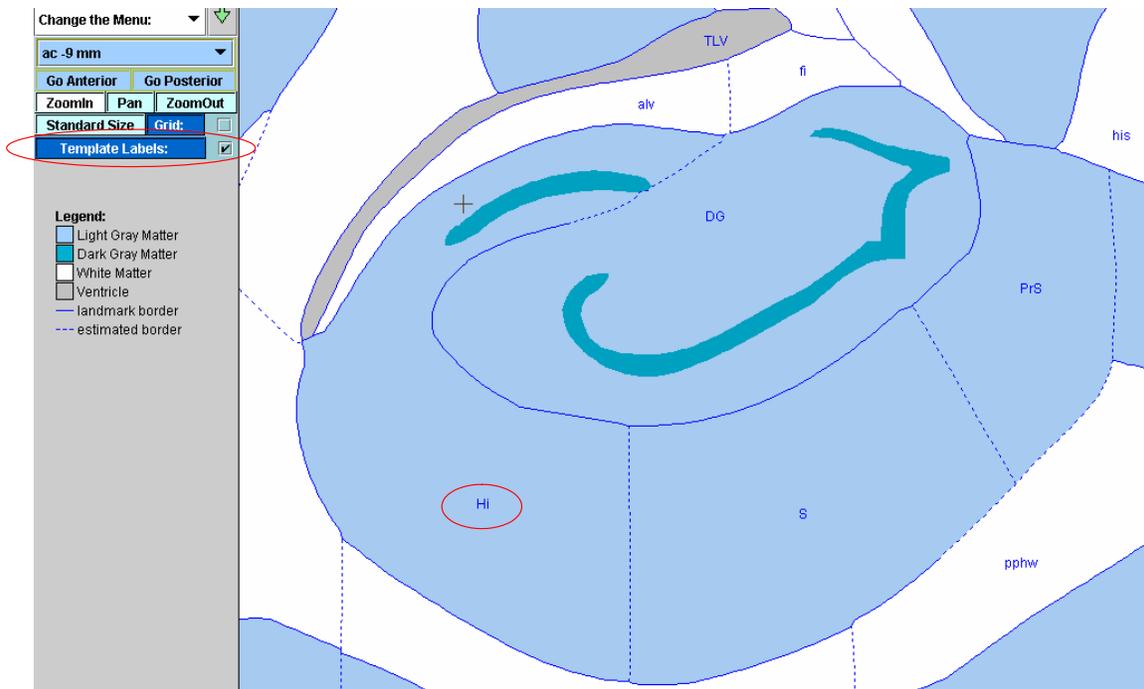

**Figure 16: The visitor identifies the structure of interest, clicks ‘ZoomIn’ (upper left) and clicks-and-drags to produce a box around the area to be enlarged (lower center).**

She identifies the area that appeared darkest in the experimental slide in the enlarged image (Fig. 17). It appears to be in the dentate gyrus or the hippocampus. To identify the structure in which it is located she clicks the check-box for Template Labels and finds that the structure where it appears is labeled ‘Hi’ (Fig. 18).

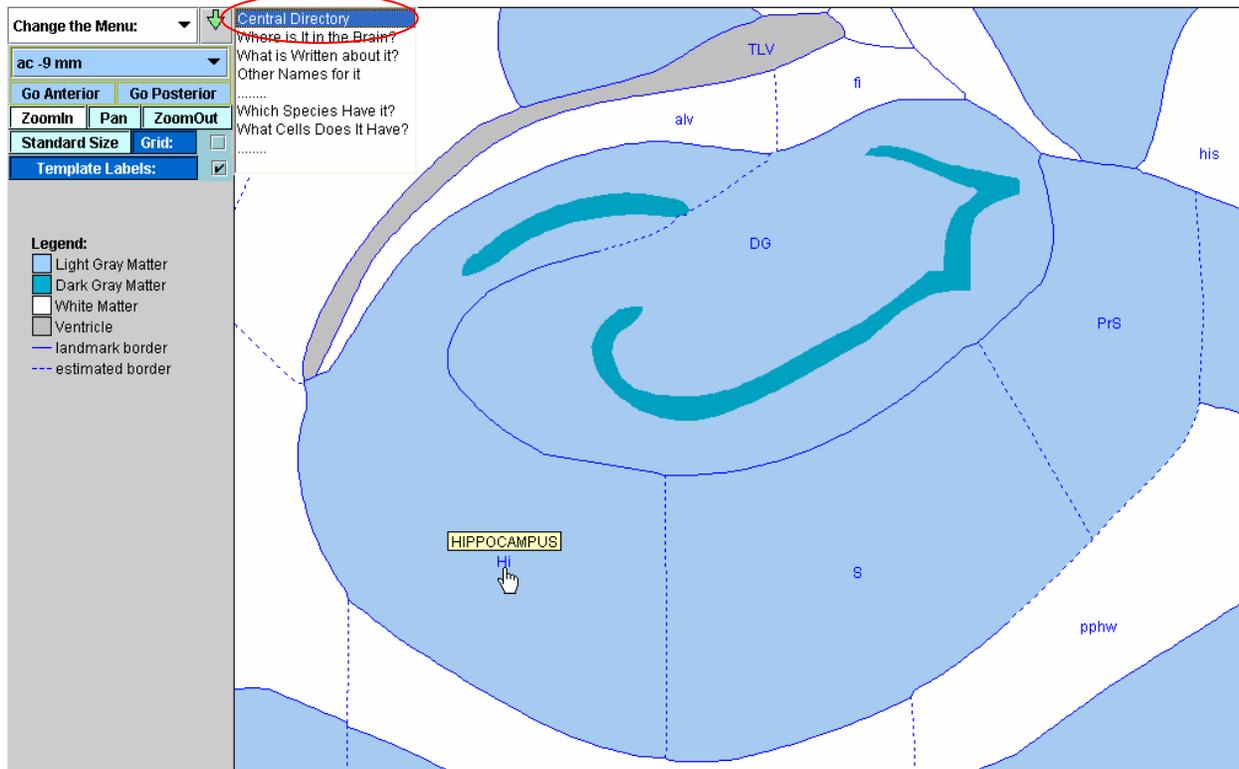

**Figure 17: The location of the darkly stained area in Figure 12 corresponds to an area of ‘Dark Gray Matter’ in the atlas section (red oval).**

**Figure 18: A click next to ‘Template Labels’ (upper left) shows that the structure is Hi.**

To confirm the name of the structure represented by Hi she places the cursor on the label and sees the full name, hippocampus (Fig. 19).

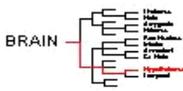

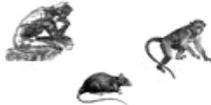

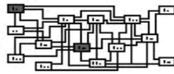

**Figure 19: Placing the cursor on a label reveals the full name of a structure.**

To find out more about the hippocampus, she clicks the label 'Hi'. BrainInfo displays a message box in the upper left corner that lists the kinds of information available. Clicking 'Central Directory' takes the visitor to the same page she would find if she conducted a Search by Name for 'hippocampus' (Fig. 20).

# HIPPOCAMPUS

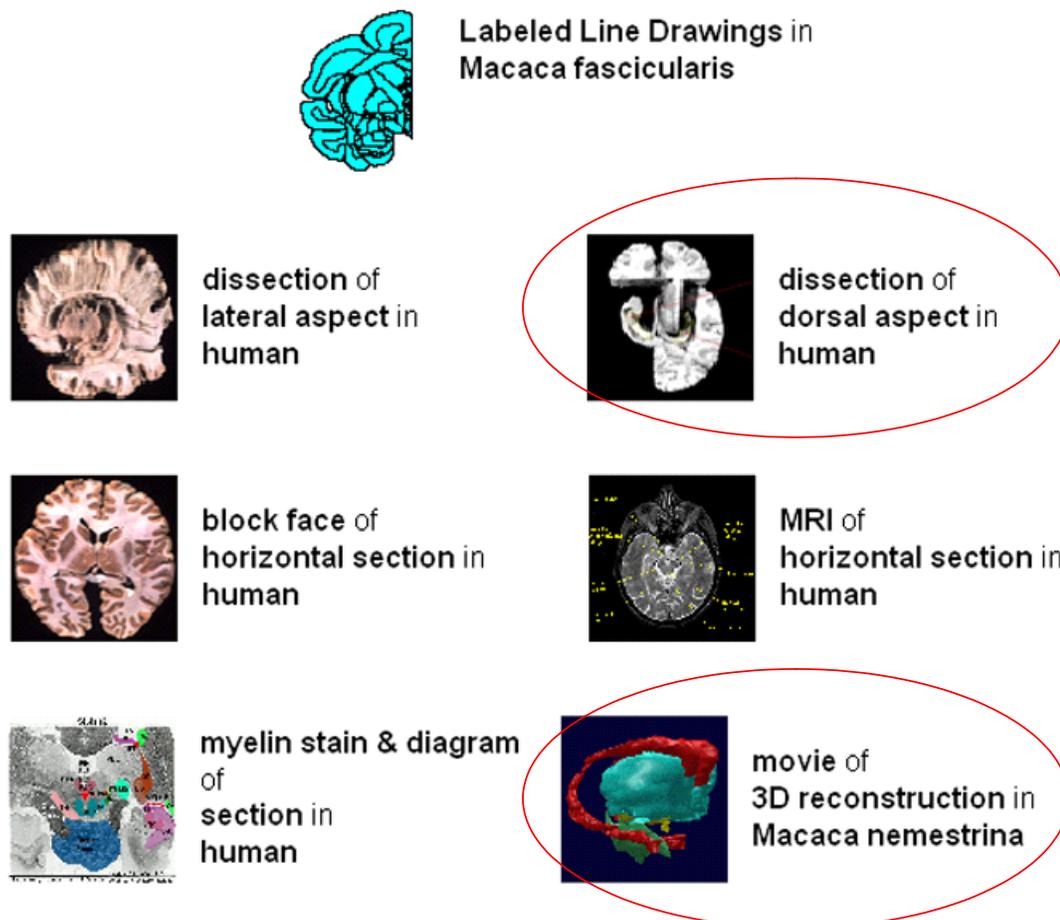

Standard Acronym: **Hi**

<p><b>Where is It in the Brain?</b></p> 	<p><b>What is Written about It?</b></p> 
<p><b>Show It!</b></p> 	<p><b>Other Names for It</b></p> <p>Encephalon 腦          MO3T <b>BRAIN</b> cerebro          cerveau <b>Gehirn</b></p>
<p><b>Internal Structure</b></p> 	<p><b>Which Species Have It?</b></p> 
<p><b>What Cells Does It Have?</b></p> 	<p><b>Connectivity</b></p> 
<p><b>Genes Expressed There</b></p> 	

**Figure 20: BrainInfo's Central Directory for the hippocampus.**

If the visitor wishes to see other illustrations of the hippocampus, she clicks 'Show It!' for a page of thumbnails that shows the choices available (Fig. 21).

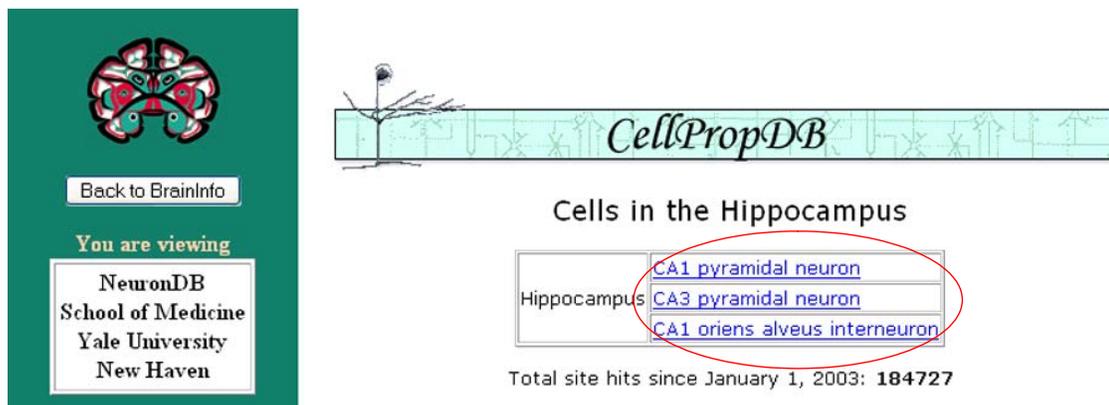

# HIPPOCAMPUS

**Figure 21: Thumbnail images that link to illustrations of the hippocampus at other websites.**

If she clicks to see a dissection of the hippocampus in the human brain (Fig. 21, upper right), BrainInfo takes her to the page in the Digital Anatomist (DigitalAnatomist 2005) a different website at the University of Washington. If she elects to see a movie of the hippocampus and related structures rotating in space, she clicks the corresponding thumbnail (Fig. 21, lower right) and BrainInfo sends her to a website at the Laboratory of NeuroImaging at UCLA (LONI 2005).

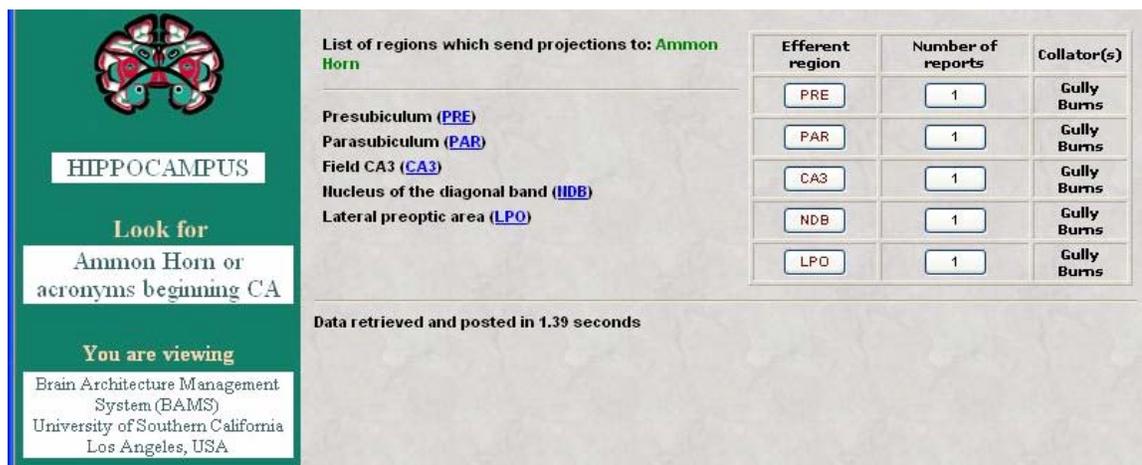

A visitor interested in learning the kinds of neurons found in the hippocampus clicks ‘What Cells Does It Have?’ in the central directory (Fig. 20). BrainInfo sends her to the Cell Properties Database at Yale University (SenseLab 2005) where she can explore the neurophysiological and neurochemical characteristics of three cell types (Fig. 22).

The screenshot shows the CellPropDB website interface. On the left is a green sidebar with a brain icon, a 'Back to BrainInfo' button, and text identifying the user as viewing 'NeuronDB' at 'School of Medicine, Yale University, New Haven'. The main content area has a header 'CellPropDB' with a neuron diagram. Below it is the title 'Cells in the Hippocampus' and a search box containing 'Hippocampus'. A dropdown menu is open, listing three cell types: 'CA1 pyramidal neuron', 'CA3 pyramidal neuron', and 'CA1 oriens alveus interneuron', with the last one circled in red. At the bottom, it states 'Total site hits since January 1, 2003: 184727'.

**Figure 22: The cell properties part of the neuron database at Yale University provides highly detailed information about three kinds of cell found in the hippocampus.**

If the visitor is interested in connections of the hippocampus with other brain structures, she clicks 'Connectivity' in the Central Directory (Fig. 20) and BrainInfo sends her to the Brain Architecture Management System at USC (BAMS 2005) (Fig. 23).

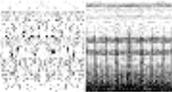

The screenshot shows the Brain Architecture Management System (BAMS) interface. On the left is a green sidebar with a brain icon, the word 'HIPPOCAMPUS' in a box, and text asking to 'Look for Ammon Horn or acronyms beginning CA' and identifying the user as viewing 'Brain Architecture Management System (BAMS)' at 'University of Southern California, Los Angeles, USA'. The main content area has a title 'List of regions which send projections to: Ammon Horn' and lists several regions: 'Presubiculum (PRE)', 'Parasubiculum (PAR)', 'Field CA3 (CA3)', 'Nucleus of the diagonal band (NDB)', and 'Lateral preoptic area (LPO)'. To the right is a table with three columns: 'Efferent region', 'Number of reports', and 'Collator(s)'. The table lists the regions and their corresponding data. Below the table, it states 'Data retrieved and posted in 1.39 seconds'.

Efferent region	Number of reports	Collator(s)
PRE	1	Gully Burns
PAR	1	Gully Burns
CA3	1	Gully Burns
NDB	1	Gully Burns
LPO	1	Gully Burns

**Figure 23: The Brain Architecture Management System at USC provides detailed information about afferents to the hippocampus in the rat.**

One can access illustrations of the internal, architectonic structure of many cortical areas of the macaque through BrainInfo. For example, to see photomicrographs of area 4 of Brodmann, one conducts a 'Search by Name' and clicks 'Internal Structure' in the Central Directory for area 4 (Fig. 24).

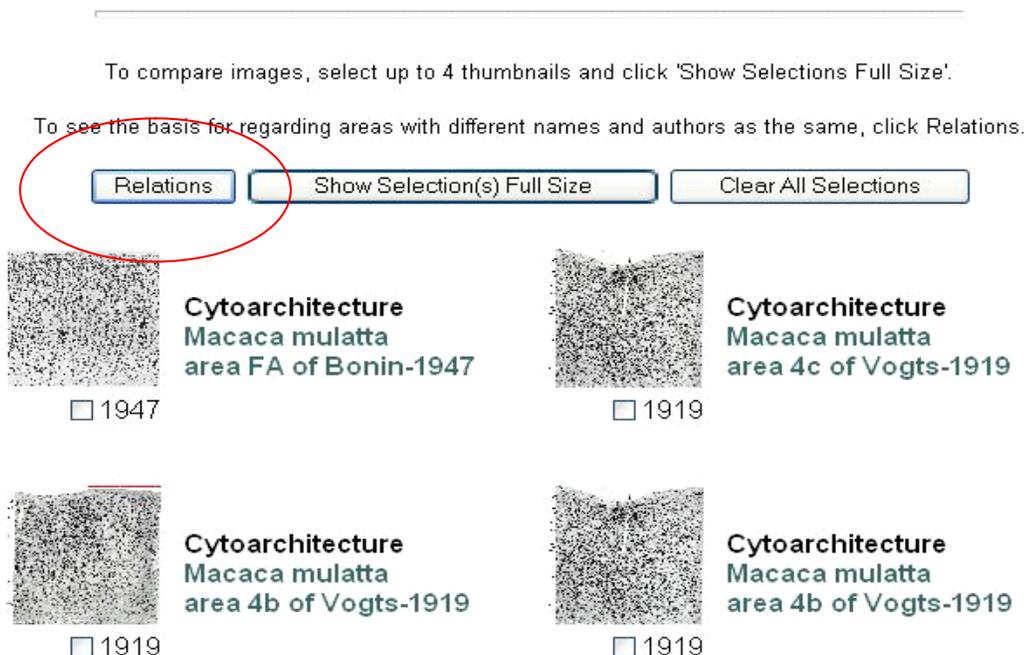

## area 4 of Brodmann-1909

<p><b>Where is It in the Brain?</b></p> 	<p><b>What is Written about It?</b></p> 
<p><b>Show It!</b></p> 	<p><b>Other Names for It</b></p> <p>Encephalon   MO3I <b>BRAIN</b> cerebro  cerveau <b>Gehirn</b></p>
<p><b>Internal Structure</b></p> 	<p><b>Which Species Have It?</b></p> 

**Figure 24: BrainInfo's Central Directory for Brodmann's area 4 in the macaque.**

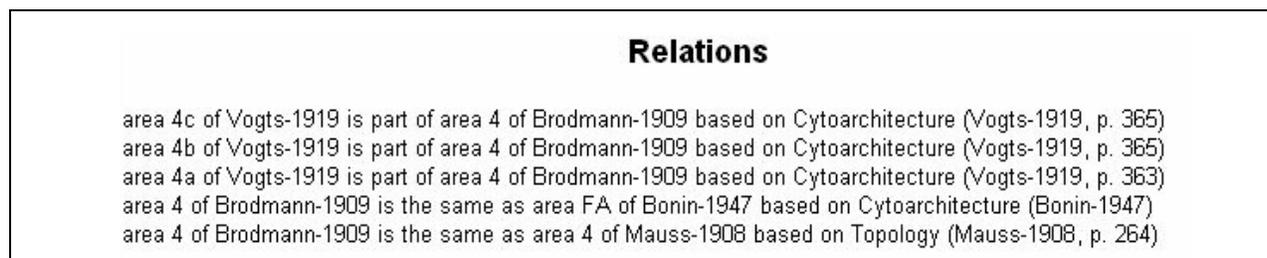

BrainInfo displays a number of thumbnails of Brodmann's area 4, some published by other authors under different acronyms (Fig. 25).

## area 4 of Brodmann-1909

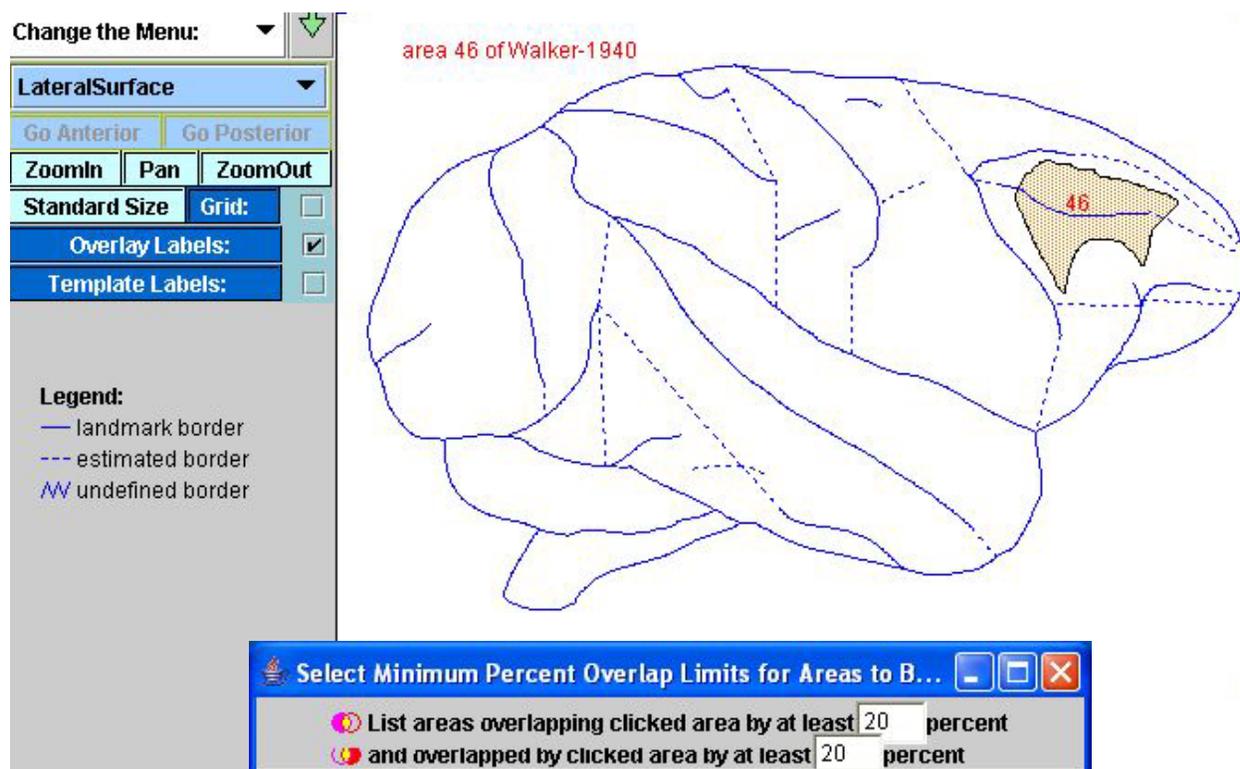

**Figure 25: Thumbnail images of a few of the photomicrographs of area 4 that one can select for comparison; the images appear in reverse chronological order.**

To determine how the areas illustrated by other authors relate to Brodmann's area 4, one clicks 'Relations' and a message box appears (Fig. 26).

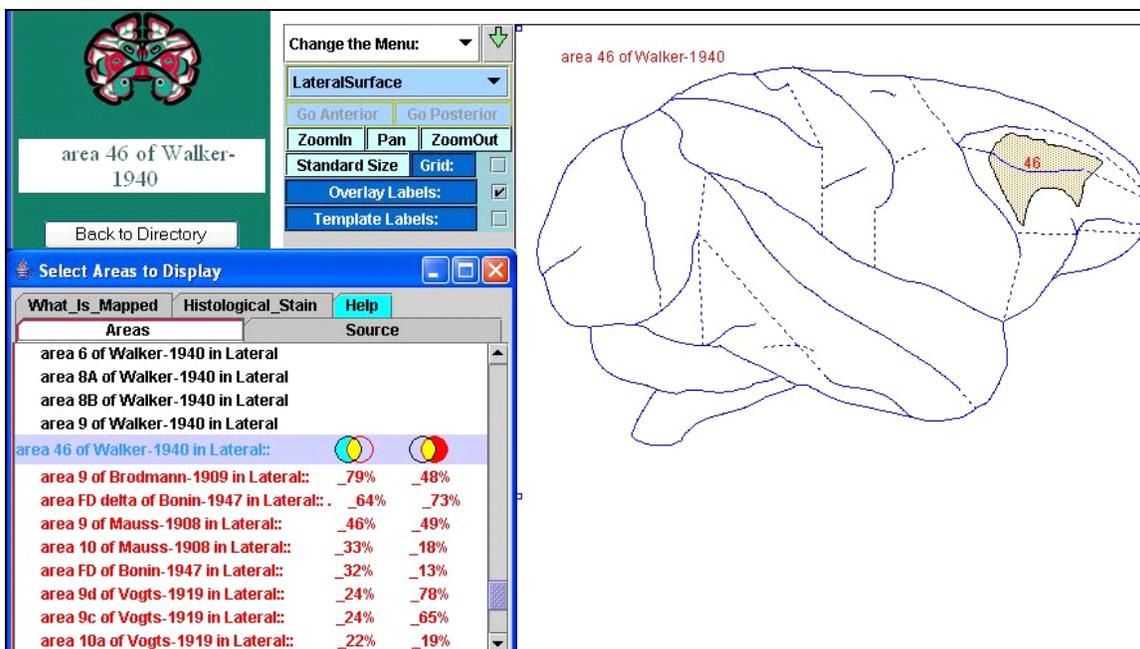

**Figure 26: The 'Relations' message box gives the publications and page numbers where authors stated the relations of Brodmann's area 4 to cortical areas with other names.**

BrainInfo also provides another useful approach to comparison of cortical areas defined by different investigators. Area 46 of Walker-1940, for example, occupies a portion of the frontal lobe segmented in different ways by different authors. If a visitor goes to the Central Directory for ‘Walker’s area 46’ and clicks ‘Show It!’ BrainInfo displays a lateral cortical view of the macaque brain to which Walker’s area 46 has been mapped (Fig. 27).

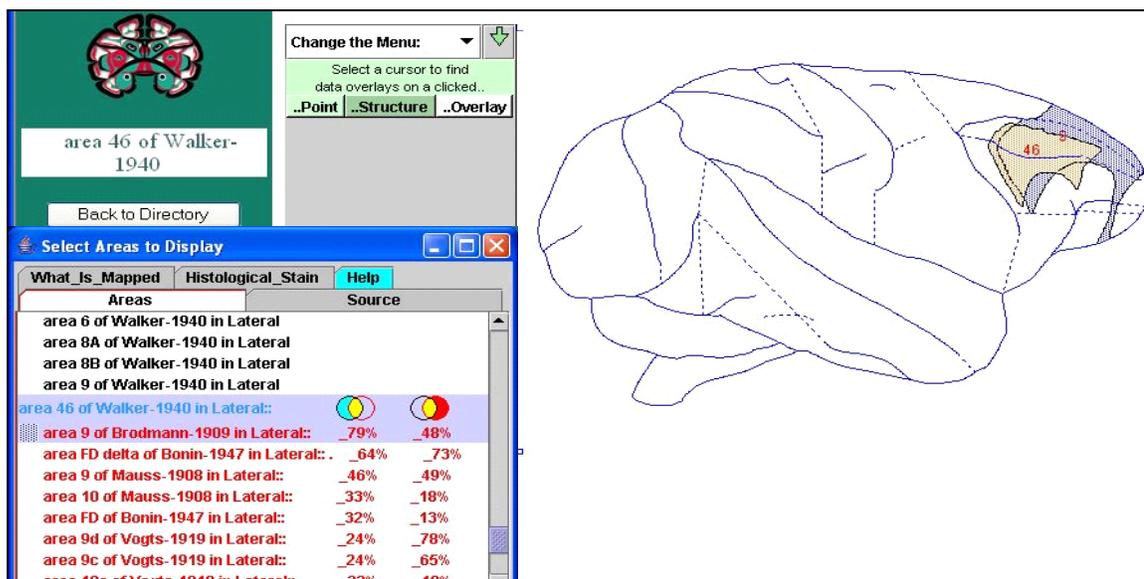

**Figure 27: Walker’s area 46 mapped to a lateral view of the macaque brain. The message box at the bottom of the screen allows one to specify the minimum degree of overlap that is of interest between area 46 and any other structure.**

The visitor clicks in succession: ‘Change the Menu’ (Fig. 27; upper left), ‘Overlaps Menu’, and ‘Overlay’ to obtain a cursor that will allow him to select the area, in this case area 46, that he wishes to compare with other areas defined by different authors in the same region. The visitor specifies in a message box the minimum percent overlap between area 46 and other areas that must pertain to be of interest (here 20%). When he clicks in area 46 a box appears in the lower left corner of the screen listing all areas mapped to the same cortical view that overlap area 46, or are overlapped by area 46, by 20% or more (Fig. 28).

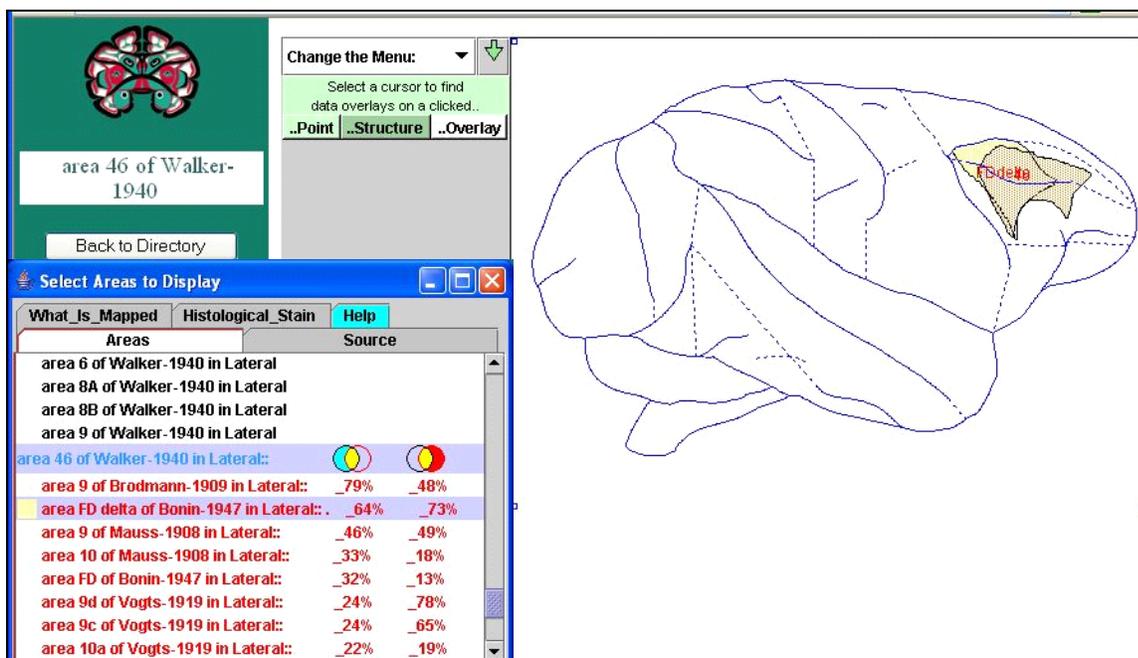

**Figure 28:** A box labeled ‘Select Areas to Display’ shows the index area in purple (here area 46 of Walker-1940) and, in red, all areas that overlap area 46 by 20% or more.

To visualize the overlap with another cortical area, such as Brodmann’s area 9, he presses the Control Key and clicks the name of the second structure in the box labeled ‘Select Areas to Display’. He finds that while most of area 46 (79% in the table) overlaps area 9, less than half of area 9 (48%) overlaps area 46 (Fig. 29).

**Figure 29:** Area 9 of Brodmann-1909 overlaps Walker’s area 46 but appears to involve a greater portion of the frontal pole.

To compare area 46 with another area, say area FD delta of Bonin-1947, the visitor presses the Control Key clicks area 9 in the ‘Select Areas’ box to turn it off and clicks area FD for display. He finds that the boundaries of area 46 with area FD (Fig. 30) are more nearly coincident than with area 9 (Fig. 29); this would suggest that Walker’s area 46 and von Bonin and Bailey’s area FD delta more likely represent the same cortical ‘structure’ than Walker’s area 46 and Brodmann’s area 9. One can test this hypothesis by examining the architecture of the three areas.

**Figure 30: The boundaries of area 46 are more nearly coincident with those of area FD delta shown here than with those of area 9 shown in Figure 29.**

To view the architectonic structure of area 46 and related areas without losing the screen display of overlaps, the visitor opens BrainInfo again in a new window, navigates to the Central Directory for area 46 of Walker and clicks ‘Internal Structure’ (see Fig. 24). He clicks to select thumbnail images of the photomicrographs he wants to compare and clicks ‘Show Selection(s) Full Size’ (see Fig. 25).

The source of each photomicrograph is identified by placing the cursor over it (Fig. 31). For detailed visual comparison he can click-and-drag individual images into proximity.

**Figure 31: For the name of the cortical area, species, stain, author, and source of a photo one moves the cursor (red arrow) over it and reads the message box (upper left).**

## Discussion

BrainInfo (2005) is a public repository and portal to neuroanatomical information on the Web. Its power as a rapid purveyor of detailed information about the brain is based on a unique combination of a text/numeric object-oriented database (SQL), a geographic information systems (GIS) image database and a webserver (IIS powered by asp.net on an MS Windows 2000 server). In contrast to many neuroscientific web resources, it allows visitors to locate information by navigating intuitively according to the logic of neuroscientific inquiry as opposed to navigating the websites organized as virtual libraries. In BrainInfo users go directly from the home page to the information they seek without having to pick their way through a series of menus and site maps wondering whether the information exists at the site and guessing where therein it may be

located. They need not learn how the site is organized, because a structured ontology based on NeuroNames (Bowden and Martin 1995; Bowden and Dubach 2003) and a Template Atlas of the primate brain (Bowden and Martin 1992; Martin and Bowden 2000) allow the indexing of text and image information at an unmatched level of detail. Once users have found the specific information they seek, the system assists them in going directly to the next information they are likely to want, seamlessly and transparently, regardless of whether the next information is on the same server or on a server thousands of miles away.

BrainInfo is also unique in that a query to Google (2005) about any one of some 2000 neuroanatomical names that have appeared in one or more PubMed (2005) citations in the past 25 years produces a listing with a link to BrainInfo on the first page (Fig. 2). BrainInfo extends the indexing power of search engines like PubMed and Google by applying semantic search strategies based on a systematic ontology of more than 14,000 names and 1500 acronyms for more than 2,400 neuroanatomic concepts defined in terms of some 500 primary structures of the human and nonhuman primate brain.

The system addresses directly the challenge that, in neuroscience above all, images are as important for communication as words and numbers. The neuroanatomical coordinates of data in a standard, stereotaxic space is as important an indexing attribute as its name in a standard, controlled vocabulary. BrainInfo is designed to provide direct access to every kind of textual and image data that is usefully indexed to primary structures of the mammalian brain, from MRI activation to cell types to histological evidence of gene expression.

BrainInfo enables web access to images of original data, such as photomicrographs of the internal structure of cortical areas published by multiple authors over many decades. A visitor to BrainInfo can display multiple images on a screen, click and drag them to optimal positions for visual comparison and, if they are named differently, identify the original authors' reasons for regarding them as equivalent (Fig. 26). In addition, BrainInfo enables one to view hundreds of surface views of cortical areas extracted from the literature and mapped to standard views of the brain, to compare their locations and shapes visually and to obtain a quantitative measure of their overlap.

**Table I: Websites to which BrainInfo serves as a portal.**

In 2004, BrainInfo, in addition to providing access to its own macaque brain database, served as a portal to information at nine different websites and was preparing to link into five others (Table 1). An average of 240 visitors per day downloaded more than 10,000 pages per day.

## Acknowledgments

The authors express great appreciation to Hwa Jun (Evan) Song for his dedicated and creative approach to development of the BrainInfo website, and to Erik MacArthur and Andra Erickson for mapping data from the literature into the image database. Development of the system is supported by grants from the National Library of Medicine (LM06243), the Human Brain Project/NIMH (MH069259; and the National Center for Research Resources (RR-00166) to the University of Washington.
